

# Structure II Recitation 4/5

Composite Section

Before we start ...

Today's Tasks:

Homework Example (Composite Section)

Lab Session (Composite Section)

Reminder:

Final Report Due Date: 4/12!!!!!!!!!!!!

**Tower Project Score Sheet**

<b>PRELIMINARY REPORT (re-submit with final report)</b>	<b>40</b>	
<b>TESTING</b>	<b>60</b>	
Tower weight $\leq$ 4oz (15 pts); height = 48" (5 pts); holds $\geq$ 50 lbs (5 pts)	30	
Correct Materials (5 pts) (scaled if doesn't meet requirements)		
Efficiency $(4/\text{weight OZ})+(\text{load LBS}/50)+(\text{load LBS}/\text{weight OZ})\times 1.5$ (scaled based on class rank)	30	
<b>FINAL REPORT REQUIREMENTS</b>	<b>150</b>	
<b>Preliminary Design Development</b>	<b>20</b>	
How cross-sectional design of preliminary tower was chosen	4	
How elevation of preliminary tower was developed (e.g. bracing, taper, etc.)	4	
Why/how cross-section was or was not adjusted from preliminary report	4	
Why/how elevation of tower was or was not adjusted from preliminary report	4	
Discussion of how basic principles of columns supported these decisions	4	
<b>Revised/Tested Tower Design Analysis [SHOW WORK AND UNITS!]</b>	<b>50</b>	
Calculated/modeled axial forces and derivation of required member cross-sectional areas from axial forces (consider both crushing and buckling)	10	
Estimated weight calculation using actual member sizes used – include weight from members, glue, and gussets, etc.	7	
Member properties table: A, r, L, slenderness ratio (L/r), utilization ratio (actual load / allowable load)	7	
Indicate critical member (largest utilization ratio)	8	
Tower stability (as a whole) - buckling calculation	8	
Prediction of capacity of tower and mode of failure	10	
<b>Illustration of Final/Tested Design</b>	<b>20</b>	
Cross-section and elevations(s) of tower	5	
Perspective(s) or isometric of tower (no screenshots!)	5	
Overall dimensions labeled (height, width, etc.) with units	5	
Member sizes labeled (cross-sectional area, length of vertical members and cross-bracing) with units	5	
<b>Testing Results</b>	<b>30</b>	
Final weight and height of tower	6	
Tested capacity of tower	6	
Observations of testing (loading, any buckling observed, etc.)	6	
Description of mode of failure	6	
Images of failure	6	
<b>Post-Testing Analysis</b>	<b>30</b>	
Comparison of testing results with predicted capacity and modes of failure	10	
Discussion of discrepancies between results	10	
Suggested improvements for future designs with reasoning discussed	10	
<b>FINAL GRADE</b>	<b>250</b>	

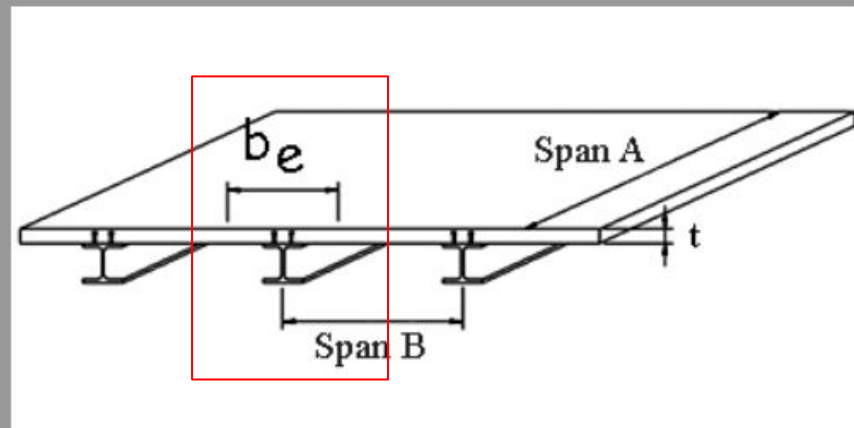

Using the strength method, determine the required amount of flexural steel reinforcement,  $A_s$ , for the simple span beam (shown in section). The beam carries a dead and live floor load from a one-way slab in addition to its own self weight at 150 PCF. For the given bar size, determine the number of bars to obtain the required  $A_s$ . Check  $A_{s,min}$  and  $\epsilon_{t}$ . Calculate the strength moment,  $M_n$  for the final beam design and check that  $\phi M_n$  is  $> M_u$ .

DATASET: 1

-2-

-3-

W-section	W18X71
span A	57 FT
span B	12 FT
slab thickness, $t$	9 IN
steel yield stress, $F_y$	50 KSI
concrete ultimate stress, $f_c$	7 KSI

# Analysis Procedure (LRFD)

## Case1 – PNA within slab

Given: Slab and beam geometry  
W-section size and steel grade  
(floor loads)

Find: pass/fail or capacities

1. Define effective flange width,  $b_e$
2. Calculate the effective depth of the concrete stress block,  $a$
3. If  $a$  is within concrete slab, the full steel section is in tension and:  
 $M_p = T z$   
 $M_n = M_p = A_s F_y (d/2 + t - a/2)$
4.  $M_u \leq \phi M_n$

$$T = C$$

$$A_s f_y = 0.85 f'_c a b_e$$

$$a = \frac{A_s f_y}{0.85 f'_c b_e}$$

$$b_e - a - M_u - w_u - DL - LL$$

Table 1-1 (continued)

W-section

W18X71

Look at AISC 14, Table 1-1 and  
 get the values we need based on  
 your W- Section type:

- Area (A) = 20.9 in<sup>2</sup>
- Depth (d) = 18.5 in
- Width (bf) = 7.64 in
- Nominal Weight = 71 lb/ft

# Q1: Effective Width of the Concrete Flange (be)

Choose the smallest value of the three:

1/4 the span of the steel beam (1/4 x Span A)

$$1/4 \times (57 \times 12) = 171 \text{ in}$$

Covert Unit (ft to in)

2 x (8 x slab thickness) + bf ← AISC 14, Table 1-1

$$2 \times (8 \times 9) + 7.64 = 151.64 \text{ in}$$

On center spacing

$$\text{Span B} = 12 \times 12 = 144 \text{ in}$$

Covert Unit (ft to in)

Answer = 144 in

W-section	W18X71
span A	57 FT
span B	12 FT
slab thickness, t	9 IN
steel yield stress, Fy	50 KSI
concrete ultimate stress, f'c	7 KSI

b<sub>e</sub> is the **least** total width :

- Total width: 1/4 of the beam span
- Overhang: 8 x slab thickness
- Overhang: 1/2 the clear distance to next beam (i.e. b<sub>e</sub> is the web on center spacing)

## Q2: Depth of Concrete Stress Block (a)

AISC 14, Table 1-1

$$\begin{aligned} a &= \frac{A_s \times f_y}{0.85 \times f_c' \times b} \\ &= \frac{20.9 \times 50000}{0.85 \times 7000 \times 144} \\ &= \underline{1.21965 \text{ in}} \end{aligned}$$

↑  
be (from Q1)

## Q3: Is Depth (a) Within the Slab?

See if a is smaller than slab thickness,  
For my situation, a (1.21965 in) < t (9 in)

Answer = Yes!

W-section	W18X71
span A	57 FT
span B	12 FT
slab thickness, t	9 IN
steel yield stress, $F_y$	50 KSI
concrete ultimate stress, $f_c'$	7 KSI

$$a = \frac{A_s f_y}{0.85 f_c' b}$$

Area (A) = 20.9 in<sup>2</sup>  
Depth (d) = 18.5 in  
Width (bf) = 7.64 in  
Nominal Weight = 71 lb/ft

#### Q4: The Nominal Bending Moment (Mn)

Mn

$$= A_s \times F_y \times (d/2 + t - a/2)$$

$$= 20.9 \times 50000 \times (18.5 / 2 + 9 - 1.21965 / 2) / 1000$$

$$= \underline{18433.98 \text{ k-in}}$$

AISC 14, Table 1-1

Q2 Covert Unit (lb to k)

W-section	W18X71
span A	57 FT
span B	12 FT
slab thickness, t	9 IN
steel yield stress, Fy	50 KSI
concrete ultimate stress, f'c	7 KSI

$$\text{Area (A)} = 20.9 \text{ in}^2$$

$$\text{Depth (d)} = 18.5 \text{ in}$$

$$\text{Width (bf)} = 7.64 \text{ in}$$

$$\text{Nominal Weight} = 71 \text{ lb/ft}$$

#### Q5: The Factored Bending Resistance (ΦMn)

$$0.9 \times M_n = 0.9 \times 18433.98 = \underline{16590.58 \text{ k-in}}$$

#### Q6: The Factored Design Moment (Mu)

$$M_u = \Phi M_n / 12 = 16590.58 / 12 = \underline{1382.548 \text{ k-ft}}$$

Covert Unit (k-in to k-ft)

$$M_p = T z$$

Tensile Force

Moment Arm

$$M_n = M_p = A_s F_y (d/2 + t - a/2)$$

### Q7: The Total Factored Design Load (wu)

$$M_u = w_u \times L^2 / 8$$

$$w_u = M_u \times 8 / L^2 = 1382.548 \times 8 / 57^2 = \underline{\underline{3.4042 \text{ KLF}}}$$

↑  
Q6    Span A

### Q8: The Self Weight of the Concrete Slab

$$\underline{\underline{\text{Concrete Density} \times \text{Slab Thickness (t)} = 150 \times 9 / 12 = 112.5 \text{ PSF}}}$$

↑  
Covert Unit (in to ft)

### Q9: The Total Unfactored Dead Load (Concrete+Steel) on the Beam (w\_DL)

$$w_{DL}$$

$$= DL (\text{Concrete}) + DL (\text{Steel})$$

$$= ((112.5 \times 12) + (71)) / 1000 = \underline{\underline{1.421 \text{ KLF}}}$$

↑                    ↑                    ↑                    ↑  
Q8                    Span B                    Covert Unit (lb to k)

AISC 14, Table 1-1

W-section	W18X71
span A	57 FT
span B	12 FT
slab thickness, t	9 IN
steel yield stress, Fy	50 KSI
concrete ultimate stress, f'c	7 KSI

Area (A) = 20.9 in<sup>2</sup>  
 Depth (d) = 18.5 in  
 Width (bf) = 7.64 in  
Nominal Weight = 71 lb/ft

$$M_u = \frac{(1.2W_{DL} + 1.6W_{LL})l^2}{8}$$

### Q10: The Actual Unfactored Beam Live Load ( $w_{LL}$ )

$$w_u = 1.2 (w_{DL}) + 1.6 (w_{LL})$$

$$\begin{aligned} w_{LL} &= (w_u - 1.2 (w_{DL})) / 1.6 \\ &= (3.4042 - 1.2 \times 1.421) / 1.6 \\ &= \underline{\underline{1.0619 \text{ KLF}}} \end{aligned}$$

### Q11: The Actual Floor Live Load (Floor Capacity) (LL)

$$LL = w_{LL} / \text{Span B} = 1.0619 / 12 \times 1000 = \underline{\underline{88.492 \text{ PSF}}}$$

↑  
Q10

↑  
Covert Unit (k to lb)

W-section	W18X71
span A	57 FT
span B	12 FT
slab thickness, t	9 IN
steel yield stress, $F_y$	50 KSI
concrete ultimate stress, $f'_c$	7 KSI

Area (A) = 20.9 in<sup>2</sup>  
Depth (d) = 18.5 in  
Width (bf) = 7.64 in  
Nominal Weight = 71 lb/ft

$$M_u = \frac{(1.2W_{DL} + 1.6W_{LL})l^2}{8}$$

**SO IT BEGINS**

**THE GREAT BATTLE OF OUR  
SEMESTER**

## Goals

To observe the bending behavior of non-connected beams and slabs

To observe the bending behavior of a composite section.

To compare the deflection of the two systems.

## Procedure

1. Place the chipboard slab on the foam beam but do not attach the end clips.
2. Place the 10 washer weights in the center and measure the deflection.
3. Repeat the procedure but now with the ends of the slab and the beam clipped together.
4. Again, measure the deflection.
5. Compare the deflections of the two systems.
